Bootstrap Restyling — Login Page + Team Page

COSC2408 Capstone | Week 4 Sprint 1

Author: Ujjawal Mittal (BA/UX) | Date: 07/08/2026

1. Purpose

This document sets out what the team page needs to contain and what the login restyling work covers. It is written so that UX can start on designs without needing to ask what data is available, and so developers know exactly which parts of the login page they are allowed to touch.

There are two pieces of work in this sprint:

- Team page: a new page showing the team name and each member's photo, name, role, and a short blurb.
- Login page: a visual refresh only. No behaviour changes.

2. Scope

2.1 In Scope

- Built on the existing RMIT Garage boilerplate. No new frameworks or UI component libraries.
- Restyling the existing login page UI (colours, typography, spacing, layout, button and input styling).
- Building a new team page displaying member info.
- Team member content stored in code (src/data/team.ts). No database or CMS.
- Adding a sidebar navigation link to the team page, labelled "Team info".
- Responsive layout for desktop, tablet, and mobile.
- All text must be easy to read against its background — avoid low-contrast colour combinations like light grey on white.

2.2 Out of Scope

- Any change to authentication logic, Firebase Auth calls, or session handling.
- Redirect behaviour after a successful or failed login.
- Adding, removing, or renaming login form fields.
- Password reset, sign-up, or "remember me" flows.
- Admin screens or any way to edit team members from the UI.
- Database schema changes.

3. Team Page Requirements

3.1 Content Fields

Each team member card must display the following fields:

Field	Required	Validation Rule	Display Rule	Notes
Name	Yes	2–100 characters.	Shown in bold as the card heading. Wraps to a second line if needed.	
Photo	Yes	JPG, PNG or WebP. Square, min 200×200px. Under 300KB. Stored in /public/team/.	Displayed as a circle or rounded square, cropped from centre. Falls back to initials if missing.	Real photo of member, supplied by them.
Role	Yes	2–50 characters. Must match an agreed team role.	Shown directly under the name in a smaller, lighter style. Single line.	

Blurb	No	Max 200 characters. Plain text, no HTML or line breaks.	Shown under the role. Up to three lines, then truncated with an ellipsis.	
-------	----	---	---	--

3.2 Page Heading

- The page shows the team name as its main heading, above the member cards.
- Team name stored in `src/data/team.ts` alongside the member list — not hardcoded in the page component.
- Maximum 30 characters. Plain text, single line.
- An optional one-line subheading may sit under it (up to 80 characters). If empty, no gap is left behind.

3.3 Layout

- All cards are the same height regardless of blurb length.
- Desktop: 3 cards per row, remaining cards centred underneath.
- Tablet: 2 cards per row.
- Mobile: 1 card per row, full width.
- Cards are display only — not clickable and do not link anywhere.

3.4 Navigation

- The team page is linked from the sidebar navigation.
- The sidebar label is "Team info".
- The link uses the same styling and active state as the existing sidebar items.

3.5 Functional Requirements

- FR-01: The team page shall be accessible only to authenticated users.
- FR-02: The team page shall display all team members in a card grid layout.
- FR-03: The team name shall appear as the page heading.
- FR-04: Each member card shall display photo (or fallback), name, role, and blurb.
- FR-05: All team member data shall be stored in `src/data/team.ts` — not fetched from a database.

4. Login Page Requirements

The login page already works.

4.1 What Can Change

- Colours, background, borders, and shadows.
- Typography: font sizes, weights, heading and label styles.
- Spacing, alignment, and overall page layout.
- Button and input field appearance, including hover, focus, and disabled states.
- The visual treatment of error and loading messages — but not their wording or when they appear.
- Responsive behaviour across mobile, tablet, and desktop.

4.2 What Must Not Change

- Existing auth logic and any Firebase Auth calls.
- Session behaviour, including how a session is created, stored, or expired.
- Where the user is sent after logging in or after a failed attempt.
- Form field names, IDs, and the order fields are submitted in.
- Client-side validation rules and the conditions that trigger each error.
- The number of form fields on the page.

If a design change would require any of the above to be modified, raise it with the PM before starting.

4.3 Functional Requirements

- FR-06: The login page shall retain all existing functionality (email/password sign-in, Google sign-in, redirect on success).

- FR-07: The login page shall display the team/app name as the page heading.
- FR-08: Form validation error messages shall remain clearly visible.

5. Edge Cases

These need a designed state, not just a code fallback. UX should provide a treatment for each.

Case	What Happens	Expected Handling
Photo fails to load	File path is wrong or image is broken.	Show initials avatar (e.g. "UM") on a neutral background. Same size and shape as a real photo. No broken image icon, no layout shift.
Photo not square	Image is portrait or landscape.	Centre crop to a square. Do not stretch or squash the image.
Missing photo	Member did not supply a photo.	Display initials-based avatar with a neutral background colour.
Blurb over 200 characters	Content is longer than the agreed limit.	Truncate at 200 characters and add an ellipsis. Card height stays the same.
Long name	Name is close to the 100 character limit.	Wrap to a second line. If it still does not fit, truncate with an ellipsis.
Long role	Role label is close to the 50 character limit.	Keep to one line and truncate with an ellipsis. Do not shrink the font.
Slow image loading	Photos load after the page.	Reserve the image space so the card does not jump once photos appear.
Unauthenticated access	User tries to access team page without logging in.	Redirect to login page immediately.

6. Acceptance Criteria

The work is done when all of the following are true:

- The team page shows the team name as a heading above the cards.
- The team page shows all member cards, each with a photo (or fallback), name, role, and blurb.
- All content comes from src/data/team.ts. Nothing is fetched from a database.
- Every edge case in section 5 has a designed state and behaves as described.
- Cards are equal height and the grid works on mobile, tablet, and desktop.
- A sidebar link labelled "Team info" opens the team page and shows an active state while on it.
- The login page looks updated but logs in exactly as it did before, with the same errors and the same redirect.
- No file relating to auth logic or session handling has been modified.
- All text is easy to read against its background on both pages.
- This requirements document is linked in the Planner card notes.
- Requirements have been reviewed and acknowledged by PM and UX.

7. What UX Needs to Deliver

- A page heading treatment for the team name, including how it sits above the card grid at each screen width.
- Team page mockups at mobile, tablet, and desktop widths.
- A single member card component design showing all four fields.
- Card states covering: broken photo (initials fallback), truncated blurb, long name, and long role.
- Login page mockup with button and input styling, including hover, focus, disabled, and error states.
- A colour palette for the project — UX defines it this sprint and it applies to both pages.
- Colours, fonts, and spacing values written out so developers do not have to guess from the image.

Any questions on the above, message on the team chat.

8. Sign-Off

This document must be reviewed by the PM before the Planner card moves to Done.
